

PROFESSIONAL PROFILE

Technical Product Owner with 12+ years across financial services and fintech, moving from QA and test automation through IT business analysis into product ownership. Comfortable working with REST APIs, Postman, Swagger and SQL, and experienced writing clear, technically grounded user stories and acceptance criteria in close collaboration with engineering, QA and architecture. Use AI tools (Microsoft Copilot, NotebookLM) day-to-day for story drafting, acceptance criteria generation and requirements synthesis, and currently building hands-on agentic AI and RAG skills through a set of independent projects, working through the evaluation and safety requirements and what it would take to move a build into a regulated production environment. SAFe POPM certified.

Project Portfolio: [saranya-selvaraj.github.io](#)

CORE COMPETENCIES

- **Agentic AI & RAG Fundamentals** ((prompt engineering, RAG, agent workflow design, evaluation, guardrails)
 - Cross-Functional Delivery in Regulated Environments (CBI, GDPR, PCI-DSS)
 - SAFe PI Planning & Sprint Refinement
- Squad Product Backlog Ownership
 - Feature Refinement, User Stories & Acceptance Criteria
 - Concept, Prototype, Adoption (proven via independent builds)

PROFESSIONAL EXPERIENCE

- IT Business Analyst (hybrid BA / Product Owner), FBD Insurance

Dec 2023 – Present

 - Own the JIRA backlog and write the user stories and acceptance criteria for a BA-led product team, translating compliance and business requirements into work engineering can deliver against.
 - Led the backlog for migrating 14 paper-based insurance products onto a paperless Statement of Fact system, working closely with UX, engineering and QA to keep delivery aligned with CBI regulation and GDPR.
 - Scoped and prioritised onboarding and lifecycle features for a third-party insurance platform, covering New Business, MTAs and Renewals for broker motor products.
 - Use Microsoft Copilot and NotebookLM daily to draft stories, generate acceptance criteria and surface edge cases faster; the same practical AI habit carries into my independent agentic AI projects.
 - Built Power Automate workflows and Power BI reports that reduced manual effort in document generation and improved reporting accuracy; worked with engineering on a SQL Server upgrade and a data-integration PIA/LIA.
- Senior Technical Product Manager (TPO), Mastercard

Jan 2021 – Dec 2023

 - Owned backlog and PI planning for two compliance-critical product streams: Consumer Controls (API-driven fraud prevention, transaction alerts, and card security rules used by global financial institutions) and Digital Identity Services - products operating under PCI-DSS, GDPR, and financial regulatory requirements across multiple markets.
 - Wrote and managed technical user stories in ALM Rally for API-centric and data-driven features, including new REST API creation, monolith-to-microservices migration, GDPR consent and cookie management, fraud rules configuration, and application decommission.
 - Led sprint refinements and estimation sessions end-to-end with scrum teams; presented feature elaborations to wider PI audiences and supported feature demos and UAT sign-off for product managers.
 - Worked with integration and API teams on technical story definitions, acceptance criteria, and cross-team dependency management across multiple squads in a SAFe scaled environment.
- Senior Systems Analyst / Senior QA Engineer, Fidelity Investments

Dec 2015 – Dec 2021

 - **Senior Systems Analyst (2020-2021):** Led requirements gathering and solution design for a legacy-to-Salesforce migration, building proof-of-concept features using custom objects and automated flows.

- **Senior QA Engineer (2015-2020):** Led QA strategy across integration squads on the Commissions Manager application, moving the team onto an API automation suite (FitNesse, Postman, SQL) in place of manual regression testing.

Test Lead / Analyst, Tata Consultancy Services (Clients: Citibank USA, Lloyds UK)

Feb 2010 – Aug 2014

- Delivered integration and regression testing and data-migration support across core banking, fraud detection and account-opening product streams.

AI & AGENTIC PROJECTS (INDEPENDENT)

Self-directed builds undertaken to develop real agentic AI product skills, each one built and evaluated by hand, with a written plan for what it would take to run in production. Where something below is a proposed architecture rather than what I built, I have noted that clearly.

PO Backlog Agent: Sequential-Agent Workflow Automation (Flagship)

Built end to end, AI-assisted with Claude Code: a two-agent proof of concept that runs a **Retrieve → Reason → Decide → Act** loop. It takes unstructured initiative notes, retrieves relevant context from a local Chroma DB vector store, reasons over it, and writes back structured EPICs, Features and User Stories with Given/When/Then acceptance criteria using tool and function calling against a mock backlog API.

- **Stack:** Python, Streamlit interface, Chroma DB for local RAG, Groq API (Llama-3.3-70B) for inference and structured tool calling.
- **Production-readiness plan:** defined what it would take to run this for real, including input/output guardrails for prompt injection and PII, migration from the local vector store to a hosted option (Pinecone or pgvector), an LLM-as-judge evaluation setup against ground-truth data, OAuth integration, and a mandatory human-approval step before any write-back to a live system.

NutriMed Ask: RAG Prototype & Medical Safety Architecture

Prototyped in Google AI Studio: a RAG assistant that answers nutrition and medical questions grounded in INDI/HSE-published guidance rather than general model knowledge.

- **Safety design (built):** an emergency sieve that recognises red-flag symptoms, locks the chat, and routes users to 999/112, along with a low-confidence handover path to a human dietitian instead of an uncertain answer.
- **Built vs. proposed:** the working prototype covers the retrieval and safety logic above. The production-scale RAG architecture specified on top of it, including LlamaIndex, Qdrant, Cohere rerank, query routing, and an LLM-as-judge evaluation framework (faithfulness, precision@5, recall@5), is a proposed design rather than something deployed.

YUKA PRD: Personalised AI Interpretation & Prioritisation

Wrote a full PRD for turning YUKA's generic product scores into something personal: a "what this means for you" panel and a lightweight health-goal onboarding flow, without changing the underlying scoring algorithm.

- Used RICE scoring to sequence features, prioritising food processing over personalisation, and defined the supporting metrics (completion rate, engagement, retention) alongside a GDPR health-data risk assessment.
- **Link -** <https://saranya-selvaraj.github.io/projects/yuka.html>

N8N Automated Workflow Engineering: Visual Agentic Pipelines

- Built a set of visual agent pipelines in n8n connecting Gemini models, web search, Google Sheets and automated email reporting for periodic data-synthesis tasks.

EDUCATION & CERTIFICATIONS

- SAFe Certified Product Owner / Product Manager (POPM) (2023)
- BCS Practitioner Certificate in Requirements Engineering (2025) & Foundation Certificate in Business Analysis (2024)
- Salesforce Certified Administrator (2020) | ISTQB Foundation Certification (2013)
- B.E. Computer Science Engineering, Anna University, India (2009)
